

ABSTRACT

Integration and Interconnection of light emitting source, printed circuit board and power source such that it can be used as for decorations by itself or with another product or can be used as signaling device or for communication between two living creatures. This Integration (assembly) can be flexible and scalable (configurable) or can be fixed and non-scalable. The primary components are Light emitting source, printed circuit board and power module and secondary components are inter-connectors like sockets, switches, wireless switches, remote control, wired switches, wires, magnets, etc. or any other device added to the primary component to create a new design for the patented method of use.
